The Server Client RGS* certificate from Certigna is designed to authenticate as a machine to a server.
It can be used to access several e-government processes at the RGS single star level.

This product allows you to list several sites names (it includes 4 sub-domains of the main domain) and can manage different domains and sub-domains.

trust booster

TBS INTERNET was founded in 1996 by IT security specialists to help companies comply with encryption best practices. Customers include leading companies, value-added resellers and public sectors.

Since the early days, TBS INTERNET offered a highly professional service issuing as well as installing digital certificates for its clients. As Internet usage grew and companies began to require specialized online security, it was the first to create a multi-brand digital certificate platform, securing platinum partnerships with major SSL providers.

Thanks to it's own certification authority "TBS X509" the company can provide competitive authenticated certificates very well supported in browsers.

Created in 2009 by Dhimyotis, Certigna is an entirely French certification authority, certified RGS by the DGME and the ANSSI.

Proposing competitive and qualitative certificates, this new actor of French certification provides innovating products to meet any needs.

Equipment
Requires a recent server
Compatible with browsers released after 2007

Functionalities
Full authentication of the website and its owner
